Abstract: In this paper, we study the growth of solutions of higher order linear differential equations with meromorphic coefficients of $\varphi$-order on the complex plane. By considering the concepts of $\varphi$-order and $\varphi$-type, we will extend and improve many previous results due to Chyzhykov–Semochko, Belaïdi, Cao–Xu–Chen, Kinnunen.

Keywords: Linear differential equations, Entire function, Meromorphic function, $\varphi$-order, $\varphi$-type.

1. Introduction

Let us consider the following linear differential equations
\begin{align}
f^{(k)} + A_{k-1}(z)f^{(k-1)} + \cdots + A_0(z)f &= 0, \\
f^{(k)} + A_{k-1}(z)f^{(k-1)} + \cdots + A_0(z)f &= F(z),
\end{align}
where $k \geq 2, A_0 \not\equiv 0$ and $F \not\equiv 0$. It is well-known that if the coefficients $A_0, A_1, \ldots, A_{k-1}$ and $F$ are entire functions, then all solutions of (1.1) and (1.2) are entire. The equation (1.1) has at least one solution of infinite order if some of coefficients are transcendental. For more details about the growth of solutions of equations (1.1) and (1.2), the reader can refer to [14]. In this paper, we use the standard notations of Nevanlinna value distribution theory of meromorphic functions (see [10, 14, 18, 22]). The term meromorphic function throughout this paper means meromorphic in the whole complex plane $\mathbb{C}$. This will not be recalled in the next statements.

To study the growth of meromorphic functions, we recall the following definitions. For all $r \in \mathbb{R}$, we define $\exp_1 r = \exp r = e^r$ and $\exp_{p+1} r = \exp(\exp_p r)$, $p \in \mathbb{N} = \{1, 2, \ldots\}$. Inductively, for all $r \in (0, +\infty)$ large enough, we define $\log_1 r = \log r$ and $\log_{p+1} r = \log(\log_p r)$, $p \in \mathbb{N}$. We also denote $\exp_0 r = r = \log_0 r$, $\exp_{-1} r = \log_1 r$ and $\log_{-1} r = \exp_1 r$.

Definition 1 [13]. The iterated $p$-order of a meromorphic function $f$ is defined by
\[ \rho_p(f) := \limsup_{r \to +\infty} \frac{\log T(r,f)}{\log r}, \quad p \in \mathbb{N}, \]
where $T(r,f)$ is the Nevanlinna characteristic function of $f$. If $f$ is an entire function, then the iterated $p$-order is defined as
\[ \tilde{\rho}_p(f) := \limsup_{r \to +\infty} \frac{\log_{p+1} M(r,f)}{\log r} = \rho_p(f), \]
where $M(r,f) = \max\{|f(z)| : |z| = r\}$ is the maximum modulus of $f$. 
Note that $\rho_1(f) = \rho(f)$ is the usual order and $\rho_2(f)$ is the hyper-order.

**Definition 2** [13]. The growth index of the iterated $p$-order of a meromorphic function $f$ is defined by

$$i(f) = \begin{cases} 
0 & \text{if } f \text{ is rational,} \\
\min \left\{ j \in \mathbb{N} : \rho_j(f) < +\infty \right\} & \text{if } f \text{ is transcendental and } \rho_j(f) < +\infty \text{ for some } j \in \mathbb{N}, \\
+\infty & \text{if } \rho_j(f) = +\infty \text{ for all } j \in \mathbb{N}.
\end{cases}$$

Historically, Bernal [4] was the first one who introduced the idea of the iterated order to study the growth of solutions of complex differential equations. In [13], Kinnunen considered the growth of solutions of equations (1.1) and (1.2) with entire coefficients of a finite iterated $p$-order and extended many previous results obtained for the usual order and the hyper-order.

**Theorem A** [13]. Let $A_0(z), \ldots, A_{k-1}(z)$ be entire functions such that $i(A_0) = p\ (0 < p < \infty)$. If either $\max \{i(A_j) : j = 1, 2, \ldots, k - 1\} < p$ or $\max \{\rho_j(A_j) : j = 1, 2, \ldots, k - 1\} < \rho_p(A_0)$, then every solution $f \neq 0$ of equation (1.1) satisfies $i(f) = p + 1$ and $\rho_{p+1}(f) = \rho_p(A_0)$.

In [3], the second author has extended Theorem A when most of the coefficients $A_0(z), \ldots, A_{k-1}(z)$ have the same order by using the concept of iterated $p$-type as follows.

**Theorem B** [3]. Let $A_0(z), \ldots, A_{k-1}(z)$ be entire functions, and let $i(A_0) = p\ (0 < p < \infty)$. Assume that

$$\max \{\rho_p(A_j) : j = 1, 2, \ldots, k - 1\} \leq \rho_p(A_0) = \rho\ \ (0 < \rho < +\infty)$$

and

$$\max \{\tau_p(A_j) : \rho_p(A_j) = \rho_p(A_0)\} < \tau_p(A_0) = \tau\ \ (0 < \tau < +\infty),$$

where

$$\tau_p(f) = \limsup_{r \to +\infty} \frac{\log_p M(r, f)}{r^{\rho_p(f)}}.$$ 

Then, every solution $f \neq 0$ of equation (1.1) satisfies $i(f) = p + 1$ and $\rho_{p+1}(f) = \rho_p(A_0) = \rho$.

In [5], Cao–Xu–Chen improved Theorems A and B by considering meromorphic coefficients instead of entire coefficients. In [16], Liu–Tu–Shi made a small modification in the original definition of $[p,q]$-order introduced by Juneja–Kapoor–Bajpai [11] in order to study the growth of entire solutions of equations (1.1) and (1.2). After that, Li and Cao [15] investigated the growth of meromorphic solutions of equations (1.1) and (1.2) with meromorphic coefficients of $[p,q]$-order which improved many results in [3, 5, 13, 16].

**Definition 3** [15, 16]. Let $p \geq q \geq 1$ be integers. The $[p,q]$-order of transcendental meromorphic function $f$ is defined by

$$\rho_{[p,q]}(f) = \limsup_{r \to +\infty} \frac{\log_p T(r, f)}{\log_q r}.$$ 

If $f$ is transcendental entire function, then

$$\rho_{[p,q]}(f) = \limsup_{r \to +\infty} \frac{\log_{p+1} M(r, f)}{\log_q r}.$$ 

Note that $\rho_{[p,1]}(f) = \rho_p(f)$ is the iterated $p$-order (see [13, 14]).

Then any non-zero meromorphic solution \( f \) of Chyzhykov and Semochko \cite{ChyzhykovSemo}

Then every meromorphic solution \( f \) of zeros of a meromorphic function \( f \)

Here, we give two results due to Li-Cao in \cite{LiCao}

Let \( f \) be meromorphic functions such that

Then if there exist some other coefficients \( A_j(j = 1, \ldots, k-1) \) having the same \([p, q]\)-order as \( A_0 \),

Then any non-zero meromorphic solution \( f \) whose poles are of uniformly bounded multiplicities

It is clear that Theorem C and Theorem D improve respectively Theorem A and Theorem B

Definition 6 \cite{ChyzhykovSemo}. Let \( \varphi \) be an increasing unbounded function on \([1, +\infty)\).

If \( f \) is an entire function, then the \( \varphi \)-orders are defined by

\[
\begin{align*}
\rho^0_\varphi(f) &= \limsup_{r \to +\infty} \frac{\varphi(T(r, f))}{\log r}, \\
\rho^1_\varphi(f) &= \limsup_{r \to +\infty} \frac{\varphi(T(r, f))}{\log \log r}.
\end{align*}
\]
Definition 7 [1]. Let \( \varphi \) be an increasing unbounded function on \([1, +\infty)\). We define the \( \varphi \)-types of a meromorphic function \( f \) with \( \varphi \)-order \( p \in (0, +\infty) \) by

\[
\tau_0^\varphi(f) = \limsup_{r \to +\infty} \frac{e^{\varphi(T(r,f))}}{r^p}, \quad \tau_1^\varphi(f) = \limsup_{r \to +\infty} \frac{e^{\varphi(T(r,f))}}{r^{p^2}}.
\]

If \( f \) is an entire function, then the \( \varphi \)-types are defined as

\[
\tilde{\tau}_0^\varphi(f) = \limsup_{r \to +\infty} \frac{e^{\varphi(M(r,f))}}{r^p}, \quad \tilde{\tau}_1^\varphi(f) = \limsup_{r \to +\infty} \frac{e^{\varphi(M(r,f))}}{r^{p^2}}.
\]

By symbol \( \Phi \) we define the class of positive unbounded increasing functions on \([1, +\infty)\), such that \( \varphi(e^t) \) grows slowly, i.e., \( \forall c > 0 : \lim_{r \to +\infty} \frac{\varphi(e^t)}{\varphi(e^t)} = 1 \).

Example 1. Let \( f \) be a meromorphic function. One can see that \( \varphi(r) = \log_p r, (p \geq 2) \) belongs to the class \( \Phi \) and \( \varphi(r) = \log r \notin \Phi \). Moreover, the \( p^2 \)-order of the function \( f \) coincides with its iterated \( p \)-order, i.e., \( p^2 \) \( \rho \)-order of the function \( f \). As a particular case, for \( \varphi = \log_2 \in \Phi \) we have \( \rho^0_{\log_2} = \rho_1 \) and \( \rho^1_{\log_2} = \rho_2 \) which are respectively the usual order and the hyper-order of \( f \).

The following result due to Chyzhykov–Semochko [7] investigates the growth of entire solutions of equation (1.1) when the coefficients are entire functions of \( \varphi \)-order.

Theorem E [7]. Let \( \varphi \in \Phi \) and \( A_0, A_1, \ldots, A_{k-1} \) be entire functions such that

\[
\max\{\rho_0^\varphi(A_j), j = 1, \ldots, k - 1\} < \rho_0^\varphi(A_0).
\]

Then every solution \( f \neq 0 \) of (1.1) satisfies \( \rho^1_\varphi(f) = \rho^0_\varphi(A_0) \).

We recall that the linear measure of a set \( E \subset (0, +\infty) \) is defined by

\[
m(E) = \int_0^{+\infty} \chi_E(t) \, dt
\]

and the logarithmic measure of a set \( F \subset (1, +\infty) \) is defined by

\[
lm(F) = \int_1^{+\infty} \frac{\chi_F(t)}{t} \, dt,
\]

where \( \chi_A \) is the characteristic function of a set \( A \). The upper density of a set \( E \subset (0, +\infty) \) is defined by

\[
\overline{\text{dens}} E = \limsup_{r \to +\infty} \frac{m(E \cap [0, r])}{r}.
\]

The upper logarithmic density of a set \( F \subset (1, +\infty) \) is defined by

\[
\log \overline{\text{dens}} F = \limsup_{r \to +\infty} \frac{\lm(F \cap [1, r])}{\log r}.
\]

Definition 8 [10, 22]. For \( a \in \overline{\mathbb{C}} = \mathbb{C} \cup \{\infty\} \), the deficiency of \( a \) with respect to a meromorphic function \( f \) is defined as

\[
\delta(a, f) = \liminf_{r \to +\infty} \frac{m(r, 1/(f - a))}{T(r, f)} = 1 - \limsup_{r \to +\infty} \frac{N(r, 1/(f - a))}{T(r, f)}, \quad a \neq \infty,
\]

\[
\delta(\infty, f) = \liminf_{r \to +\infty} \frac{m(r, f)}{T(r, f)} = 1 - \limsup_{r \to +\infty} \frac{N(r, f)}{T(r, f)}.
\]
Recently, the second author has studied the growth of entire solutions of equation (1.1) when the coefficients are entire functions of \( \varphi \)-order and obtained the following results.

**Theorem F** [2]. Let \( G \) be a set of complex numbers \( z \) satisfying \( \log \text{dens} \{|z| : z \in G| > 0 \). Let \( \varphi \in \Phi \) and let \( A_0, A_1, \ldots, A_{k-1} \) be entire functions satisfying
\[
\max \{\beta_0(\varphi_j) : j = 0, 1, \ldots, k-1\} \leq \alpha \quad (0 < \alpha < +\infty)\]
Suppose, there exists a real number \( \beta \) satisfies \( 0 < \beta < \alpha \) such that for any given \( \varepsilon \) \( (0 < 2\varepsilon < \alpha - \beta) \), we have
\[
T(r, A_0) \geq \log \left( \varphi^{-1}\left((\alpha - \varepsilon) \log r\right)\right)
\]
and
\[
T(r, A_j) \leq \log \left( \varphi^{-1}(\beta \log r)\right), \quad j = 1, \ldots, k - 1
\]
as \( |z| \to +\infty \) for \( z \in G \). Then every non-zero solution \( f \) of equation (1.1) satisfies \( \beta_1(\varphi) = \alpha \).

**Theorem G** [1]. Let \( A_0(z), \ldots, A_{k-1}(z) \) be entire functions, and let \( \varphi \in \Phi \). Assume that
\[
\max \{\beta_0(\varphi_j) : j = 1, \ldots, k-1\} \leq \beta_0(\varphi) = \rho < +\infty \quad (0 < \rho < +\infty)
\]
and
\[
\max \{\beta_0(\varphi_j) : j = 1, \ldots, k-1\} \leq \beta_0(\varphi) = \tau < +\infty \).
Then every solution \( f \neq 0 \) of (1.1) satisfies \( \beta_1(\varphi) = \beta_0(\varphi) \).

### 2. Main results

The aim of this paper is to investigate the growth of meromorphic solutions of equations (1.1) and (1.2) with meromorphic coefficients of finite \( \varphi \)-order. By using the concept of \( \varphi \)-order, we can cover arbitrary growth of solutions of equations (1.1) and (1.2) which improves several results in [1–3, 5, 7, 13]. To do that, we firstly introduce the following quantities by an analogous manner with the definitions of the \( \varphi \)-orders.

**Definition 9.** Let \( \varphi \) be an increasing unbounded function on \([1, +\infty)\). We define the \( \varphi \)-convergence exponents of the sequence of zeros of a meromorphic function \( f \) by
\[
\lambda_{\varphi}^0(f) = \lambda_{\varphi}^1(f) = \limsup_{r \to +\infty} \frac{\varphi(e^{N(r,1/f)})}{\log r}.
\]
Similarly, the notations \( \lambda_{\varphi}^0(f) \) and \( \lambda_{\varphi}^1(f) \) can be used to denote the \( \varphi \)-convergence exponents of the sequence of distinct zeros of \( f \).

Now, we list our main results.

**Theorem 1.** Let \( \varphi \in \Phi \) and \( A_0, A_1, \ldots, A_{k-1} \) be meromorphic functions. Suppose, there exists one coefficient \( A_s \) \( (s \in \{0, 1, \ldots, k-1\}) \) such that
\[
\max \left\{\frac{\beta_0(\varphi_j)}{A_s} : j = 0, 1, \ldots, k-1 \ (j \neq s)\right\} < \beta_0(\varphi) < +\infty.
\]
Then every transcendental meromorphic solution \( f \) whose poles are of uniformly bounded multiplicities of (1.1) satisfies
\[
\beta_1(\varphi) \geq \beta_0(\varphi) \geq \beta_0(\varphi).
\]
Furthermore, if all solutions of (1.1) are meromorphic solutions, then there is at least one meromorphic solution, say \( f_1 \), verifies \( \beta_1(\varphi) = \beta_0(\varphi) = \beta_0(\varphi) = \beta_0(\varphi) \).
Remark 1. By setting $\varphi(r) = \log_{p+1} r$ $(p \geq 1)$ in Theorem 1, we obtain Theorem 2.2 in [5].

**Theorem 2.** Let $\varphi \in \Phi$ and $A_0, A_1, \ldots, A_{k-1}$ be meromorphic functions such that

$$\max \left\{ \lambda^0_{\varphi} \left( \frac{1}{A_0} \right), \rho^0_{\varphi}(A_j) : j = 1, \ldots, k-1 \right\} < \rho^0_{\varphi}(A_0) < +\infty.$$  

Then every non-zero meromorphic solution $f$ whose poles are of uniformly bounded multiplicities of (1.1) satisfies $\rho^1_{\varphi}(f) = \rho^0_{\varphi}(A_0)$.

**Remark 2.** Clearly, Theorem 2 is an extension of Theorem E from entire solutions of equation (1.1) to the case of meromorphic solutions of equation (1.1) with meromorphic coefficients instead of entire coefficients. Furthermore, by setting $\varphi(r) = \log_{p+1} r$ $(p \geq 1)$ in Theorem 2, we obtain Theorem A when the coefficients of (1.1) are entire functions.

If there exist some other coefficients $A_j (j = 1, \ldots, k-1)$ having the same $\varphi$-order as $A_0$, then we have the following result.

**Theorem 3.** Let $\varphi \in \Phi$ and $A_0, A_1, \ldots, A_{k-1}$ be meromorphic functions such that $\lambda^0_{\varphi}(1/A_0) < \rho^0_{\varphi}(A_0)$ and

$$\max \{\rho^0_{\varphi}(A_j) : j = 1, \ldots, k-1 \} \leq \rho^0_{\varphi}(A_0) = \rho_0 < +\infty, \quad (2.1)$$

$$\max \{\tau^0_{\varphi}(A_j) : \rho^0_{\varphi}(A_j) = \rho^0_{\varphi}(A_0) > 0, j = 1, \ldots, k-1 \} < \tau^0_{\varphi}(A_0) = \tau_0 (0 < \tau_0 < +\infty). \quad (2.2)$$

Then any non-zero meromorphic solution $f$ whose poles are of uniformly bounded multiplicities of (1.1) satisfies $\rho^1_{\varphi}(f) = \rho^0_{\varphi}(A_0)$.

**Remark 3.** Namely, Theorem 3 extends Theorem G from entire solutions of equation (1.1) to meromorphic solutions. Furthermore, by setting $\varphi(r) = \log_{p+1} r$ $(p \geq 1)$ in Theorem 3, we obtain Theorem 2.1 in [5] and Theorem B when the coefficients of (1.1) are entire functions.

**Theorem 4.** Let $\varphi \in \Phi$ and $A_0, A_1, \ldots, A_{k-1}$, $F \not\equiv 0$ be meromorphic functions such that $\lambda^0_{\varphi}(1/A_0) < \rho^0_{\varphi}(A_0)$ and

$$\max \{\rho^1_{\varphi}(F), \rho^0_{\varphi}(A_j) : j = 1, \ldots, k-1 \} < \rho^0_{\varphi}(A_0) < +\infty. \quad (2.3)$$

Then every meromorphic solution $f$ whose poles are of uniformly bounded multiplicities of (1.2) satisfies

$$\lambda^1_{\varphi}(f) = \lambda^0_{\varphi}(f) = \rho^1_{\varphi}(f) = \rho^0_{\varphi}(A_0)$$

with at most one exceptional solution $f_0$ satisfying $\rho^1_{\varphi}(f_0) < \rho^0_{\varphi}(A_0)$.

**Remark 4.** Theorem 4 is a counterpart of Theorem 1.6 in [15]. Moreover, if we choose $\varphi(r) = \log_{p+1} r$ $(p \geq 1)$ in Theorem 4, then we obtain a special case of Theorem 2.6 in [21].

**Theorem 5.** Let $\varphi \in \Phi$ and $A_0, A_1, \ldots, A_{k-1}$, $F \not\equiv 0$ be meromorphic functions such that

$$\max \{\rho^0_{\varphi}(A_j) : j = 0, \ldots, k-1 \} < \rho^1_{\varphi}(F).$$

If all solutions $f$ of (1.2) are meromorphic functions whose poles are of uniformly bounded multiplicities, then there holds $\rho^1_{\varphi}(f) = \rho^1_{\varphi}(F)$ for all solutions of (1.2).

**Remark 5.** Theorem 5 is a counterpart of Theorem 1.7 in [15]. Furthermore, if we choose $\varphi(r) = \log_{p+1} r$ $(p \geq 1)$ in Theorem 5, then we obtain a special case in [13, Remark 4.1, p. 399] when the coefficients of equation (1.1) are entire functions.
Theorem 6. Let $G \subset (1, +\infty)$ be a set of complex numbers $z$ satisfying

$$\log \text{dens}\{|z| : z \in G\} > 0.$$ 

Let $\varphi \in \Phi$ and $A_0, A_1, \ldots, A_{k-1}$ be meromorphic functions satisfying $\delta(\infty, A_0) = \delta > 0$ and

$$\max\{\rho^0_\varphi(A_j) : j = 0, 1, \ldots, k-1\} \leq \alpha \quad (0 < \alpha < +\infty).$$

Suppose, there exists a real number $\beta$ satisfies $0 < \beta < \alpha$ such that for any given $\varepsilon$ ($0 < 2\varepsilon < \alpha - \beta$), we have

$$T(r, A_0) \geq \log(\varphi^{-1}((\alpha - \varepsilon) \log r))$$

and

$$T(r, A_j) \leq \log(\varphi^{-1}(\beta \log r)),$$

as $|z| = r \to +\infty$ for $z \in G$. Then every non-zero meromorphic solution of equation (1.1) satisfies $\rho^1_\varphi(f) = \alpha$.

Remark 6. Theorem 6 extends Theorem F from entire solutions of equation (1.1) to meromorphic solutions.

Theorem 7. Let $G \subset (1, +\infty)$ be a set of complex numbers $z$ satisfying

$$\log \text{dens}\{|z| : z \in G\} > 0.$$ 

Let $\varphi \in \Phi$ and $A_0, A_1, \ldots, A_{k-1}, F \not\equiv 0$ be meromorphic functions satisfying

$$\max\{\rho^0_\varphi(A_j) : j = 0, 1, \ldots, k-1\} < \alpha \quad (0 < \alpha < +\infty).$$

Suppose, there exists a real number $\beta$ satisfies $0 < \beta < \alpha$ such that for any given $\varepsilon$ ($0 < 2\varepsilon < \alpha - \beta$), we have

$$|A_0(z)| \geq \varphi^{-1}((\alpha - \varepsilon) \log r)$$

and

$$|A_j(z)| \leq \varphi^{-1}(\beta \log r), \quad j = 1, \ldots, k-1$$

as $|z| = r \to +\infty$ for $z \in G$. Then, the following conclusions hold

(i) If $\rho^1_\varphi(F) \geq \alpha$, then all meromorphic solutions $f$ whose poles are of uniformly bounded multiplicities of equation (1.2) satisfy $\rho^1_\varphi(f) = \rho^1_\varphi(F)$.

(ii) If $\rho^1_\varphi(F) < \alpha$, then every meromorphic solution $f$ whose poles are of uniformly bounded multiplicities of (1.2) satisfies

$$\lambda^1_\varphi(f) = \lambda^1_\varphi(f) = \rho^1_\varphi(f) = \alpha$$

with at most one exceptional solution $f_0$ satisfying $\rho^1_\varphi(f_0) < \alpha$.

Remark 7. Clearly, Theorem 7 is an improvement of Theorem 1.15 in [2] from entire solutions of equation (1.2) to meromorphic solutions. Furthermore, Theorem 7 is a counterpart of Theorem 1.8 in [15].
3. Preliminary lemmas

Proposition 1 [7]. If \( \varphi \in \Phi \), then
\[
\forall m > 0, \forall k \geq 0 : \frac{\varphi^{-1}(\log x^m)}{x^k} \to +\infty, \quad x \to +\infty,
\]
(3.1)
\[
\forall \delta > 0 : \frac{\log \varphi^{-1}((1+\delta)x)}{\log \varphi^{-1}(x)} \to +\infty, \quad x \to +\infty.
\]
(3.2)

Remark 8 [7]. We can see that (3.2) implies that
\[
\forall c > 0, \varphi(ct) \leq \varphi(t^c) \leq (1 + o(1))\varphi(t), \quad t \to +\infty.
\]
(3.3)

Proposition 2 [7]. Let \( \varphi \in \Phi \) and \( f \) be an entire function. Then
\[
\rho^\alpha_\varphi(f) = \tilde{\rho}^\alpha_\varphi(f), \quad j = 0, 1.
\]

Lemma 1 [6]. Let \( f \) be a meromorphic solution of equation (1.1), suppose that not all coefficients \( A_j \) are constants. Given a real number \( \gamma > 1 \), and denoting \( T(r) = \sum_{j=0}^{k-1} T(r, A_j) \), then the inequalities
\[
\log m(r, f) < T(r)\{(\log r)\log T(r)\}^\gamma \quad \text{if} \quad s = 0,
\]
\[
\log m(r, f) < r^{2s+\gamma-1}T(r)\{(\log T(r))\}^\gamma \quad \text{if} \quad s > 0
\]
take place outside of an exceptional set \( E_\gamma \) with \( \int_{E_\gamma} t^{s-1} dt < +\infty \).

Lemma 2 [8]. Let \( f_1, f_2, \ldots, f_k \) be linearly independent meromorphic solutions of equation (1.1) with meromorphic coefficients \( A_0, A_1, \ldots, A_{k-1} \). Then
\[
m(r, A_j) = O\left( \log \left( \max_{1 \leq i \leq k} T(r, f_i) \right) \right), \quad j = 0, 1, \ldots, k - 1.
\]

Lemma 3 [9]. Let \( f \) be a transcendental meromorphic function and let \( \alpha > 1 \) be a given constant. Then, there exists a set \( E_1 \subset (1, +\infty) \) with finite logarithmic measure and a constant \( B_\alpha > 0 \) that depends only on \( \alpha \) and \( i, j \) (\( j > i \geq 0 \)) such that for all \( z \) satisfying \( |z| = r \notin [0, 1] \cup E_1 \), we have
\[
\left| \frac{f^{(j)}(z)}{f^{(i)}(z)} \right| \leq B_\alpha \left\{ \frac{T(\alpha r, f)}{r} \left( \log^\alpha r \log T(\alpha r, f) \right) \right\}^{j-i}.
\]

Lemma 4 [12]. Let \( f \) be a meromorphic function and \( \varphi \in \Phi \). Then
\[
\rho^\alpha_\varphi(f') = \rho^\alpha_\varphi(f) \quad \text{for} \quad j = 0, 1.
\]

Lemma 5 [7, 12]. Let \( \varphi \in \Phi \) and \( f_1, f_2 \) be two meromorphic functions. Then
(i) \( \rho^\alpha_\varphi(f_1 + f_2) \leq \max\left\{ \rho^\alpha_\varphi(f_1), \rho^\alpha_\varphi(f_2) \right\} \) and \( \rho^\alpha_\varphi(f_1f_2) \leq \max\left\{ \rho^\alpha_\varphi(f_1), \rho^\alpha_\varphi(f_2) \right\} \) for \( j = 0, 1 \).
(ii) If \( \rho^\alpha_\varphi(f_1) < \rho^\alpha_\varphi(f_2) \), then \( \rho^\alpha_\varphi(f_1 + f_2) = \rho^\alpha_\varphi(f_1f_2) = \rho^\alpha_\varphi(f_2) \) for \( j = 0, 1 \).
Let \( \varphi \in \Phi \) and \( f \) be a meromorphic function. Then, for any set \( E_2 \subset [0, +\infty) \) with finite linear measure, there exists a sequence \( \{r_n, r_n \notin E_2\} \) such that

\[
\lim_{r_n \to +\infty} \frac{\varphi(T(r_n, f))}{\log r_n} = \rho^1_\varphi(f), \quad \left( \text{resp.} \lim_{r_n \to +\infty} \frac{\varphi(e^{T(r_n, f)})}{\log r_n} = \rho^0_\varphi(f) \right).
\]

**Proof.** The definition of \( \rho^1_\varphi(f) \) implies that there exists a sequence \( \{s_n, n \geq 1\}, s_n \to +\infty \) such that

\[
\lim_{s_n \to +\infty} \frac{\varphi(T(s_n, f))}{\log s_n} = \rho^1_\varphi(f).
\]

Setting \( m(E_2) = \delta < +\infty \). Then, for \( r_n \in [s_n, s_n + \delta + 1] \setminus E_2 \), we have

\[
\frac{\varphi(T(r_n, f))}{\log r_n} \geq \frac{\varphi(T(s_n, f))}{\log (s_n + \delta + 1)} = \frac{\varphi(T(s_n, f))}{\log s_n + \log \left(1 + \frac{\delta + 1}{s_n}\right)}
\]

Hence

\[
\lim_{r_n \to +\infty} \frac{\varphi(T(r_n, f))}{\log r_n} \geq \lim_{s_n \to +\infty} \frac{\varphi(T(s_n, f))}{\log s_n + \log \left(1 + \frac{\delta + 1}{s_n}\right)} = \rho^1_\varphi(f).
\]

By

\[
\lim_{r_n \to +\infty} \frac{\varphi(T(r_n, f))}{\log r_n} \leq \lim_{r \to +\infty} \frac{\varphi(T(r, f))}{\log r} = \rho^1_\varphi(f),
\]

we deduce that

\[
\lim_{r_n \to +\infty} \frac{\varphi(T(r_n, f))}{\log r_n} = \rho^1_\varphi(f).
\]

Similar proof for \( \rho^0_\varphi(f) \). \( \square \)

**Lemma 7.** Let \( \varphi \in \Phi \) and \( f \) be a meromorphic function satisfying \( 0 < \rho^0_\varphi(f) < +\infty \) and \( 0 < \tau^0_\varphi(f) < +\infty \). Then, for any given \( \eta < \tau^0_\varphi(f) \), there exists a set \( E_3 \subset [0, +\infty) \) with infinite logarithmic measure such that for all \( r \in E_3 \), we have

\[
\varphi(e^{T(r, f)}) > \log(\eta r^{\rho^0_\varphi(f)}).
\]

**Proof.** We denote \( \rho^0_\varphi(f) = \rho_0 \) and \( \tau^0_\varphi(f) = \tau_0 \). The definition of \( \tau^0_\varphi(f) \) implies that there exists a sequence \( \{r_m, m \geq 1\} \) tending to \( +\infty \) satisfying

\[
\left(1 + \frac{1}{m}\right) r_m < r_{m+1} \quad \text{and} \quad \lim_{m \to +\infty} \frac{e^{\varphi(e^{T(r_m, f)})}}{r_m^{\rho_0}} = \tau_0.
\]

Then, for any given \( \varepsilon \) \( (0 < \varepsilon < \tau_0 - \eta) \), there exists an integer \( m_1 \) such that for all \( m \geq m_1 \), we have

\[
e^{\varphi(e^{T(r_m, f)})} > (\tau_0 - \varepsilon) r_m^{\rho_0}.
\]

Since \( \eta < \tau_0 - \varepsilon \), there exists an integer \( m_2 \) such that for all \( m \geq m_2 \), we have

\[
\left(\frac{m}{m+1}\right)^{\rho_0} > \frac{\eta}{\tau_0 - \varepsilon}.
\]

Taking \( m \geq m_3 = \max\{m_1, m_2\} \), it follows from (3.4) and (3.5) that for any \( r \in [r_m, (1 + 1/m) r_m] \)

\[
e^{\varphi(e^{T(r, f)})} \geq e^{\varphi(e^{T(r_m, f)})} > (\tau_0 - \varepsilon) r_m^{\rho_0} \geq (\tau_0 - \varepsilon) \left(\frac{mr_m}{m+1}\right)^{\rho_0} > \eta r^{\rho_0}.
\]
Thus
\[ \varphi(e^{T(r,f)}) > \log(\eta r \rho_1^0(f)). \]

Setting \( E_3 = \bigcup_{m=m_3}^{+\infty} [r_m, (1 + 1/m) r_m] \), then the logarithmic measure \( \text{lm}(E_3) \) of \( E_3 \) satisfies
\[
\text{lm}(E_3) = \sum_{m=m_3}^{+\infty} \int_{r_m}^{(1+1/m)r_m} \frac{dt}{r} = \sum_{m=m_3}^{+\infty} \log \left(1 + \frac{1}{m}\right) = +\infty.
\]

\[ \square \]

**Lemma 8.** Let \( A_0, A_1, \ldots, A_{k-1}, F \not\equiv 0 \) be meromorphic functions and let \( f \) be a meromorphic solution of equation \((1.2)\). If \( \max \{\rho_\varphi^1(F), \rho_\varphi^1(A_j) : j = 0, 1, \ldots, k - 1\} < \rho_\varphi^1(f) \), then
\[
\lambda_\varphi^1(f) = \lambda_\varphi^1(f) = \rho_\varphi^1(f).
\]

**Proof.** Equation \((1.2)\) can be written as
\[
\frac{1}{f} = \frac{1}{F} \left( f^{(k)} - \frac{A_{k-1} f^{(k-1)}}{f} + \cdots + A_1 f' + A_0 \right).
\]

If \( f \) has a zero at \( z_0 \) of order \( l > k \) and if \( A_0, A_1, \ldots, A_{k-1} \) are all analytic at \( z_0 \), then \( F \) has a zero at \( z_0 \) of order at least \( l - k \). Then
\[
n\left( r, \frac{1}{f} \right) \leq k \cdot n \left( r, \frac{1}{F} \right) + n \left( r, \frac{1}{F} \right) + \sum_{j=0}^{k-1} n(r, A_j)
\]
and
\[
N \left( r, \frac{1}{f} \right) \leq k \cdot N \left( r, \frac{1}{F} \right) + N \left( r, \frac{1}{F} \right) + \sum_{j=0}^{k-1} N(r, A_j).
\]

By the lemma of logarithmic derivative \([10]\) and \((3.6)\), we get that
\[
m \left( r, \frac{1}{f} \right) \leq m \left( r, \frac{1}{F} \right) + \sum_{j=0}^{k-1} m(r, A_j) + O(\log r + \log T(r,f))
\]
holds for all \( |z| = r \notin E_4 \), where \( E_4 \) is a set of finite linear measure. By \((3.7)\), \((3.8)\) and the Nevanlinna’s first main theorem, we obtain
\[
T(r, f) = T \left( r, \frac{1}{f} \right) + O(1) = m \left( r, \frac{1}{f} \right) + N \left( r, \frac{1}{f} \right) + O(1)
\]
\[
\leq k \cdot N \left( r, \frac{1}{f} \right) + T(r, F) + \sum_{j=0}^{k-1} T(r, A_j) + O(\log r + \log T(r,f))
\]
holds for all sufficiently large \( r \notin E_4 \). We denote
\[
\mu = \max \{\rho_\varphi^1(F), \rho_\varphi^1(A_j) : j = 0, 1, \ldots, k - 1\}.
\]
According to Lemma 6, there exists a sequence \( \{r_n, r_n \notin E_4\} \) such that
\[
\lim_{r_n \to +\infty} \frac{\varphi(T(r_n, f))}{\log r_n} = \rho_\varphi^1(f) = \rho_1.
\]
So, if \( r_n \notin E_4 \), then for any given \( \varepsilon \) (\( 0 < 2\varepsilon < \rho_1 - \mu \)) we get
\[
T(r_n, f) \geq \varphi^{-1}((\rho_1 - \varepsilon) \log r_n). \tag{3.10}
\]
We have
\[
\max_{j=0,1,\ldots,k-1} \{ T(r_n, F), T(r_n, A_j) \} \leq \varphi^{-1}((\mu + \varepsilon) \log r_n), \tag{3.11}
\]
\[
O(\log r_n + \log T(r_n, f)) = o(T(r_n, f)). \tag{3.12}
\]
Since \( \varepsilon (0 < 2\varepsilon < \rho_1 - \mu) \), then from (3.10), (3.11) and Proposition 1, we obtain
\[
\max_{j=0,1,\ldots,k-1} \left\{ \frac{T(r_n, F)}{T(r_n, f)}, \frac{T(r_n, A_j)}{T(r_n, f)} \right\} \leq \frac{\exp \{ \log \varphi^{-1}((\mu + \varepsilon) \log r_n) \}}{\exp \{ \log \varphi^{-1}((\rho_1 - \varepsilon) \log r_n) \}}
= \exp \left\{ \ln \left(1 - \frac{\log \varphi^{-1}((\rho_1 - \varepsilon) \log r_n)}{\log \varphi^{-1}((\mu + \varepsilon) \log r_n)}\right) \right\} \log \varphi^{-1}((\mu + \varepsilon) \log r_n) \to 0
\]
as \( r_n \to +\infty \). By substituting (3.12) and (3.13) into (3.9) we deduce that for sufficiently large \( r_n \notin E_4 \), there holds
\[
(1 - o(1))T(r_n, f) \leq kN \left( r_n, \frac{1}{f} \right).
\]
From this inequality, by the monotonicity of \( \varphi \) and (3.3), we obtain \( \rho^1_p(f) \leq \lambda^1_p(f) \). In addition, we have by definition that \( \lambda^1_p(f) \leq \lambda^k_p(f) \leq \rho^k_p(f) \). Hence \( \lambda^k_p(f) = \lambda^1_p(f) = \rho^1_p(f) \). \qed

**Lemma 9.** Let \( f \) be a meromorphic function. If \( \rho^0_p(f) = \rho < +\infty \), then \( \rho^1_p(f) = 0 \).

**Proof.** Suppose that \( \rho^0_p(f) = \rho < +\infty \). Then, for any given \( \varepsilon > 0 \) and sufficiently large \( r \), we have
\[
T(r, f) \leq \log(\varphi^{-1}((\rho + \varepsilon) \log r)).
\]
By Karamata’s theorem (see [19]), it follows that \( \varphi(e^{t}) = t^{o(1)} \) as \( t \to +\infty \). Hence,
\[
\rho^{1}_p(f) = \limsup_{r \to +\infty} \frac{\varphi(T(r, f))}{\log r} = \limsup_{r \to +\infty} \frac{\varphi(\log T(r, f))}{\log r}
= \limsup_{r \to +\infty} \frac{(\log T(r, f))^{o(1)}}{\log r} \leq \limsup_{r \to +\infty} \frac{(\log(\log(\varphi^{-1}((\rho + \varepsilon) \log r))))^{o(1)}}{\log r} = 0.
\]
\qed

4. Proofs of the main results

**Proof of Theorem 1.** (i) We first prove that \( \rho^1_p(f) \leq \rho^0_p(A_s) \leq \rho^k_p(f) \) holds for every transcendental meromorphic function satisfying (1.1). From equation (1.1), we know that the poles of \( f \) can only occur at the poles of \( A_0, A_1, \ldots, A_{k-1} \), note that the multiplicities of poles of \( f \) are uniformly bounded, so we have
\[
N(r, f) \leq C_1N(r, f) \leq C_1 \sum_{j=0}^{k-1} N(r, A_j) \leq C \max\{N(r, A_j) : j = 0, 1, \ldots, k-1\} \leq O(T(r, A_s)),
\]
where $C$ and $C_1$ are two suitable positive constants. Hence
\[
T(r, f) \leq m(r, f) + O(T(r, A_s)).
\]
This inequality and Lemma 1 lead to
\[
T(r, f) \leq m(r, f) + O(T(r, A_s)) \leq O(e^{T(r, A_s)}[(\log r) \log T(r, A_s)^\gamma]), \quad \gamma > 1
\]
outside of an exceptional set $E_0$ with finite logarithmic measure. By the monotonicity of the function $\varphi$ and (3.3), we obtain $\rho^1_\varphi(f) \leq \rho^0_\varphi(A_s)$.

On the other hand, equation (1.1) can be written as
\[
-A_s = \frac{f^{(k)}}{f(s)} + A_{k-1} \frac{f^{(k-1)}}{f(s)} + \cdots + A_{s+1} \frac{f^{(s+1)}}{f(s)} + A_{s-1} \frac{f^{(s-1)}}{f(s)} + \cdots + A_0 \frac{f}{f(s)}
\]
By the lemma of logarithmic derivative and the fact that
\[
m \left(r, \frac{f}{f(s)} \right) \leq T(r, f) + T \left(r, \frac{1}{f(s)} \right) = T(r, f) + T(r, f^{(s)}) + O(1) = O(T(r, f)),
\]
it follows that
\[
T(r, A_s) \leq N(r, A_s) + \sum_{j \neq s} m(r, A_j) + O(\log r + \log T(r, f)) + O(T(r, f)) \quad (4.1)
\]
which holds for all $|z| = r \notin E_5$ where $E_5$ is a set of finite linear measure. By Lemma 6, it follows that there exists a sequence $\{r_n, n \geq 1\}$, $r_n \to +\infty$ such that for $|z_n| = r_n \notin E_5$
\[
\lim_{r_n \to +\infty} \frac{\varphi(e^{T(r_n, A_s)})}{\log r_n} = \rho^0_\varphi(A_s) = \rho_0
\]
and so
\[
T(r_n, A_s) \geq \log(\varphi^{-1}(\rho_0 - \varepsilon \log r_n)). \quad (4.2)
\]
Under the assumption $\eta = \max \{\rho^0_\varphi(A_j), \lambda^0 \varphi(1/A_s) : j \neq s\} < \rho^0_\varphi(A_s) = \rho_0$, we have
\[
N(r_n, A_s) \leq \log(\varphi^{-1}(\eta + \varepsilon \log r_n)), \quad m(r_n, A_j) \leq T(r_n, A_j) \leq \log(\varphi^{-1}(\eta + \varepsilon \log r_n)), \quad j \neq s \quad (4.3) \quad (4.4)
\]
provided for any given $\varepsilon$ that verifies $0 < 2\varepsilon < \rho_0 - \eta$. Substituting (4.2), (4.3) and (4.4) into (4.1), we get
\[
(1 - o(1)) \log(\varphi^{-1}(\rho_0 - \varepsilon \log r_n)) \leq O(\log r_n + \log T(r_n, f)) + O(T(r_n, f)) = O(T(r_n, f)).
\]
Applying (3.3), one can deduce that $\rho^0_\varphi(A_s) = \rho_0 \leq \rho^1_\varphi(f)$.

(ii) Now, we prove that there exists at least one meromorphic solution that satisfies $\rho^1_\varphi(f) = \rho^0_\varphi(A_s)$. Let $\{f_1, f_2, \ldots, f_k\}$ be a solution base of equation (1.1). By Lemma 2, we have
\[
e^{m(r, A_s)} \leq O \left( \max_{1 \leq i \leq k} T(r, f_i) \right), \quad s \in \{1, 2, \ldots, k - 1\}.
If \( N(r, A_s) \geq m(r, A_s) \), so \( T(r, A_s) \leq 2N(r, A_s) \), then \( \rho^0_\phi(A_s) \leq \lambda^0_\phi \left( \frac{1}{A_s} \right) \). This contradicts our assumption \( \lambda^0_\phi \left( \frac{1}{A_s} \right) < \rho^0_\phi(A_s) \) and asserts that \( N(r, A_s) < m(r, A_s) \). Hence, for sufficiently large \( r \), we have

\[
e^{T(r,A_s)} = O(e^{m(r,A_s)}) \leq O \left( \max_{1 \leq j \leq k} T(r, f_j) \right).
\]

This implies that there exists at least one solution of \( \{ f_1, f_2, \ldots, f_k \} \), say \( f_1 \), that satisfies \( e^{T(r,A_s)} \leq O(T(r, f_1)) \). By this inequality and (3.3) and the monotonicity of \( \phi \), we obtain

\[ \rho^0_\phi(A_s) \leq \rho^1_\phi(f_1). \]

We have proved in the first part that \( \rho^1_\phi(f_1) \leq \rho^0_\phi(A_s) \). Therefore, \( \rho^1_\phi(f_1) = \rho^0_\phi(A_s) \). \( \Box \)

**Proof of Theorem 2.** Assume that \( f \) is a non-zero meromorphic solution whose poles are of uniformly bounded multiplicities of (1.1). Equation (1.1) can be written as

\[ A_0 = - \left( \frac{f^{(k)}}{f} + A_{k-1} \frac{f^{(k-1)}}{f} + \cdots + A_1 \frac{f^1}{f} \right). \]

By the lemma of logarithmic derivative and the above equation, we have

\[
m(r, A_0) \leq \sum_{j=1}^{k-1} m(r, A_j) + \sum_{j=1}^{k} m \left( r, \frac{f^{(j)}}{f} \right) + O(1)
\]

\[ \leq \sum_{j=1}^{k-1} m(r, A_j) + O(\log r + \log T(r, f)) \quad (4.5) \]

holds possibly outside of an exceptional set \( E_0 \subset (0, +\infty) \) with finite linear measure. From this inequality, it follows

\[
T(r, A_0) = m(r, A_0) + N(r, A_0) \\
\leq N(r, A_0) + \sum_{j=1}^{k-1} m(r, A_j) + O(\log r + \log T(r, f)) \quad (4.6)
\]

holds for \( r \notin E_0 \). By Lemma 6, it follows that there exists a sequence \( \{ r_n, n \geq 1 \}, r_n \to +\infty \) such that for \( |z_n| = r_n \notin E_0 \)

\[
\lim_{r_n \to +\infty} \frac{\phi(e^{T(r_n, A_0)})}{\log r_n} = \rho^0_\phi(A_0) = \rho_0
\]

and so

\[
T(r_n, A_0) \geq \log(\phi^{-1}((\rho_0 - \varepsilon) \log r_n)) \quad (4.7)
\]

under the assumption \( \eta = \max \{ \rho^0_\phi(A_j), \lambda^0_\phi(1/A_0) : j \neq 0 \} < \rho^0_\phi(A_0) = \rho_0 \), we have

\[
N(r_n, A_0) \leq \log(\phi^{-1}(\eta + \varepsilon) \log r_n)), \quad (4.8)
\]

\[
m(r_n, A_j) \leq T(r_n, A_j) \leq \log(\phi^{-1}(\eta + \varepsilon) \log r_n)), \quad j \neq 0 \quad (4.9)
\]

provided for any given \( \varepsilon \) that verifies \( 0 < 2\varepsilon < \rho_0 - \eta \). Substituting (4.7), (4.8) and (4.9) into (4.6), we get

\[
(1 - o(1)) \log(\phi^{-1}(\rho_0 - \varepsilon) \log r_n)) \leq O(\log r_n + \log T(r_n, f))
\]
Applying (3.3), one can deduce that \( \rho_\varphi^0(A_0) = \rho_0 \leq \rho_\varphi^1(f) \).

On the other hand, from Theorem 1, we have \( \rho_\varphi^0(A_0) \geq \rho_\varphi^2(f) \). We deduce finally that every meromorphic solution \( f \neq 0 \) whose poles are of uniformly bounded multiplicities of (1.1) satisfies \( \rho_\varphi^1(f) = \rho_\varphi^0(A_0) \). \( \square \)

**Proof of Theorem 3.** Assume that \( f \) is a non-zero meromorphic solution whose poles are of uniformly bounded multiplicities of (1.1). If \( \lambda_\varphi^0(1/A_0) < \rho_\varphi^0(A_0) \) and

\[
\max \{ \rho_\varphi^0(A_j) : j = 1, \ldots, k - 1 \} < \rho_\varphi^0(A_0) < +\infty,
\]

then by Theorem 2, we obtain \( \rho_\varphi^1(f) = \rho_\varphi^2(A_0) \). Suppose that \( \lambda_\varphi^0(1/A_0) < \rho_\varphi^0(A_0) \) and

\[
\max \{ \rho_\varphi^0(A_j) : j = 1, \ldots, k - 1 \} = \rho_\varphi^0(A_0) = \rho_0 (0 < \rho_0 < +\infty),
\]

\[
\max \{ \tau_\varphi^0(A_j) : j = 1, \ldots, k - 1 \} = \rho_\varphi^0(A_0) = \tau_0 (0 < \tau_0 < +\infty).
\]

Then, there exists a set \( J \subseteq \{ 1, \ldots, k - 1 \} \) such that \( \rho_\varphi^0(A_j) = \rho_\varphi^0(A_0) = \rho_0 \ (j \in J) \) and \( \tau_\varphi^0(A_j) < \tau_\varphi^0(A_0) = \tau_0 \ (j \in J) \). Hence, there exist two constants \( \beta_1 \) and \( \beta_2 \) such that

\[
\max \{ \tau_\varphi^0(A_j) : j \in J \} < \beta_1 < \beta_2 < \tau_\varphi^0(A_0) = \tau_0.
\]

The definition of the type \( \tau_\varphi^0(A_j) \) implies that for \( r \) sufficiently large

\[
e^{m(r,A_j)} \leq e^{T(r,A_j)} < \varphi^{-1}(\log(\beta_1 r^{\rho_0})), \quad j \in J
\]  

(4.10)

and

\[
e^{m(r,A_j)} \leq e^{T(r,A_j)} < \varphi^{-1}(\log(r^{\rho_0})) < \varphi^{-1}(\log(\beta_1 r^{\rho_0})), \quad j \in \{ 1, \ldots, k - 1 \} \setminus J,
\]

(4.11)

where \( 0 < \rho_0 < \rho_0 \). Since \( \lambda_\varphi = \lambda_\varphi^0(1/A_0) < \rho_\varphi^0(A_0) = \rho_0 \), then for any given \( \varepsilon \ (0 < 2\varepsilon < \rho_0 - \lambda_\varphi) \) and sufficiently large \( r \), we have

\[
e^{N(r,A_0)} \leq \varphi^{-1}(\log(r^{\lambda_\varphi + \varepsilon})) < \varphi^{-1}(\log(r^{\rho_0 - \varepsilon})) < \varphi^{-1}(\log(\beta_1 r^{\rho_0})).
\]

(4.12)

By Lemma 7, there exists a set \( E_3 \subset [1, +\infty) \) with infinite logarithmic measure such that for all \( r \in E_3 \), we have

\[
e^{T(r,A_0)} > \varphi^{-1}(\log(\beta_2 r^{\rho_0})),
\]

(4.13)

By substituting (4.10), (4.11), (4.12) and (4.13) into (4.6), we obtain

\[
(1 - o(1)) \log(\varphi^{-1}(\log(\beta_2 r^{\rho_0}))) \leq O(\log r + \log T(r, f))
\]

(4.14)

for all \( r \in E_3 \setminus E_6 \). Since \( E_3 \setminus E_6 \) is a set of infinite logarithmic measure, then there exists a sequence of points \( |z_n| = r_n \in E_3 \setminus E_6 \) tending to +\( \infty \). Hence, by (4.14) we have

\[
(1 - o(1)) \log(\varphi^{-1}(\log(\beta_2 r^{\rho_0}))) \leq O(\log r_n + \log T(r_n, f))
\]

holds for all \( z_n \) satisfying \( |z_n| = r_n \in E_3 \setminus E_6 \) as \( |z_n| = r_n \to +\infty \). By the monotonicity of \( \varphi^{-1} \) and (3.3), we obtain \( \rho_\varphi^0(A_0) \leq \rho_\varphi^1(f) \). By Theorem 1, we have \( \rho_\varphi^1(f) \leq \rho_\varphi^0(A_0) \). Therefore \( \rho_\varphi^1(f) = \rho_\varphi^0(A_0) \) which completes the proof. \( \square \)

**Proof of Theorem 4.** Since all solutions of equation (1.2) are meromorphic functions, all solutions of the homogeneous differential equation (1.1) corresponding to equation (1.2) are also
meromorphic functions. We assume that \( \{f_1, \ldots, f_k\} \) is a meromorphic solution base of (1.1), then any solution of (1.2) has the form
\[
f = c_1 f_1 + c_2 f_2 + \cdots + c_k f_k,
\]
where \( c_1, c_2, \ldots, c_k \) are meromorphic functions satisfying
\[
c_j' = F \cdot G_j(f_1, \ldots, f_k) \cdot W^{-1}(f_1, \ldots, f_k), \quad j = 1, 2, \ldots, k,
\]
where \( G_j(f_1, \ldots, f_k) \) are differential polynomials in \( \{f_1, \ldots, f_k\} \) and their derivatives and \( W^{-1}(f_1, \ldots, f_k) \) is the Wronskian of \( \{f_1, \ldots, f_k\} \). We have by Theorem 2
\[
\rho^1_\varphi(f_j) = \rho^0_\varphi(A_0), \quad j = 1, \ldots, k.
\]
By Lemma 4, Lemma 5, (4.15) and (4.16), we get
\[
\rho^1_\varphi(f) \leq \max\{\rho^1_\varphi(f_j) \mid j = 1, \ldots, k\}, \rho^1_\varphi(F) = \rho^0_\varphi(A_0).
\]
In order to show that all solutions \( f \) of equation (1.2) satisfy \( \rho^1_\varphi(f) = \rho^0_\varphi(A_0) \) with at most one exceptional solution, say \( f_1 \), satisfying \( \rho^1_\varphi(f_1) < \rho^0_\varphi(A_0) \), we suppose that there exist two distinct meromorphic solutions \( f_1 \) and \( f_2 \) of equation (1.2) satisfying \( \rho^1_\varphi(f_i) < \rho^0_\varphi(A_0), i = 1, 2 \). Then, \( f = f_1 - f_2 \) is also a non-zero meromorphic solution of (1.1) and satisfies
\[
\rho^1_\varphi(f) = \rho^1_\varphi(f_1 - f_2) \leq \max\{\rho^1_\varphi(f_1), \rho^1_\varphi(f_2)\} < \rho^0_\varphi(A_0)
\]
which contradicts Theorem 2. By (2.3) for all solutions \( f \) of equation (1.2) satisfying \( \rho^1_\varphi(f) = \rho^0_\varphi(A_0) \), by Lemma 9, we have
\[
\max\{\rho^1_\varphi(F), \rho^1_\varphi(A_j) \mid j = 0, 1, \ldots, k - 1\} = \rho^1_\varphi(F) < \rho^0_\varphi(A_0) = \rho^1_\varphi(f).
\]
By Lemma 8, we have \( \lambda^1_\varphi(f) = \lambda^1_\varphi(f) = \rho^1_\varphi(f) \) and hence Theorem 4 is proved. \( \square \)

**Proof of Theorem 5.** Let \( f \) be a meromorphic solution of equation (1.2) and \( \{f_1, \ldots, f_k\} \) be a meromorphic solution base of (1.1) corresponding to equation (1.2). By a similar discussion as in the proof of Theorem 4, it follows from Lemma 4, Lemma 5, (4.15) and (4.16) that
\[
\rho^1_\varphi(f) \leq \max\{\rho^1_\varphi(f_j) \mid j = 1, \ldots, k\}, \rho^1_\varphi(F)\}.
\]
By the first part of the proof of Theorem 1, one can show easily that
\[
\rho^1_\varphi(f_j) \leq \max\{\rho^0_\varphi(A_j) : j = 0, \ldots, k - 1\}
\]
for \( j = 1, \ldots, k \). We obtain from the assumptions of Theorem 5 that \( \rho^1_\varphi(f_j) \leq \rho^1_\varphi(F) \) and thus
\[
\rho^1_\varphi(f) \leq \rho^1_\varphi(F).
\]
On the other hand, by Lemma 4, Lemma 5 and a simple order comparison from equation (1.2), we get
\[
\rho^1_\varphi(F) \leq \max\{\rho^1_\varphi(A_j) \mid j = 0, \ldots, k - 1\}, \rho^1_\varphi(f)\}.
\]
Since \( \rho^1_\varphi(A_j) \leq \rho^0_\varphi(A_j) < \rho^1_\varphi(F) \) \( j = 0, \ldots, k - 1 \), then
\[
\rho^1_\varphi(f) \leq \rho^1_\varphi(F).
\]
Therefore, \( \rho_\varphi^1(f) = \rho_\varphi^1(F) \).

\[ \square \]

**Proof of Theorem 6.** Assume that \( f \) is a non-zero meromorphic solution whose poles are of uniformly bounded multiplicities of \((1.1)\). Set \( G_1 = \{ |z| = r : z \in G \} \), since \( \log \text{dens} \{ |z| : z \in G \} > 0 \), then \( G_1 \) is a set with \( \int_{G_1} \frac{dr}{r} = +\infty \). Set

\[
\delta(\infty, A_0) = \liminf_{r \to +\infty} \frac{m(r, A_0)}{T(r, A_0)} = \delta > 0.
\]

Thus, for sufficiently large \( r \), we have

\[
m(r, A_0) > \frac{1}{2} \delta T(r, A_0). \tag{4.19}
\]

By substituting (2.4), (2.5) and (4.19) into (4.5), we obtain for sufficiently large \( r \) and any given \( \varepsilon \) \((0 < 2\varepsilon < \alpha - \beta)\)

\[
\frac{1}{2} \delta \log (\varphi^{-1}((\alpha - \varepsilon) \log r)) \leq \frac{1}{2} \delta T(r, A_0) \leq m(r, A_0)
\]

\[
\leq \sum_{j=1}^{k-1} m(r, A_j) + \sum_{j=1}^{k} m\left( r, \frac{f^{(j)}}{f} \right) + O(1)
\]

\[
\leq \sum_{j=1}^{k-1} T(r, A_j) + O(\log r + \log T(r, f))
\]

\[
\leq (k - 1) \log (\varphi^{-1}(\beta \log r)) + O(\log r + \log T(r, f)),
\]

it follows that

\[
(1 - o(1)) \log (\varphi^{-1}((\alpha - \varepsilon) \log r)) \leq O(\log r + \log T(r, f)) \tag{4.20}
\]

holds for all \( z \) satisfying \( |z| = r \in G_1 \setminus E_6 \) as \( |z| = r \to +\infty \). Since \( G_1 \setminus E_6 \) is a set of infinite logarithmic measure, then there exists a sequence of points \( |z_n| = r_n \in G_1 \setminus E_6 \) tending to \(+\infty\). Hence, by (4.20) we have

\[
(1 - o(1)) \log (\varphi^{-1}((\alpha - \varepsilon) \log r_n)) \leq O(\log r_n + \log T(r_n, f))
\]

holds for all \( z_n \) satisfying \( |z_n| = r_n \in G_1 \setminus E_6 \) as \( |z_n| = r_n \to +\infty \). By the monotonicity of \( \varphi^{-1} \) and arbitrariness of \( \varepsilon \) \((0 < 2\varepsilon < \alpha - \beta)\), one can obtain \( \rho_\varphi^1(f) \geq \alpha \).

On the other hand, it follows by a similar proof as in the first part of Theorem 1 that \( \rho_\varphi^1(f) \leq \alpha \). Therefore \( \rho_\varphi^1(f) = \alpha \). \( \square \)

**Proof of Theorem 7.** (i) If \( \rho_\varphi^1(F) \geq \alpha \), then it follows from Theorem 5 that \( \rho_\varphi^1(f) = \rho_\varphi^1(F) \).

(ii) If \( \rho_\varphi^1(F) < \alpha \), we prove that \( \rho_1 = \rho_\varphi^1(f) = \alpha \) for any non-zero meromorphic solution whose poles are of uniformly bounded multiplicities of \((1.1)\). We show firstly that \( \rho_1 = \rho_\varphi^1(F) \geq \alpha \).

Without loss of the generality, we suppose the contrary \( \rho_1 \leq \beta < \alpha \). Set \( G_2 = \{ |z| = r : z \in G \} \), since \( \log \text{dens} \{ |z| : z \in G \} > 0 \), then \( G_2 \) is a set with \( \int_{G_2} \frac{dr}{r} = +\infty \). From Lemma 3, there exists a set \( E_1 \subset (1, +\infty) \) with finite logarithmic measure and a constant \( B > 0 \) such that for all \( z \) satisfying \( |z| = r \notin [0, 1] \cup E_1 \), we have

\[
\left| \frac{f^{(j)}(z)}{f(z)} \right| \leq B[T(2r, f)]^{k+1}, \quad j = 1, \ldots, k.
\]

\[ \tag{4.21} \]
If \( f \) is a non-zero meromorphic solution of equation (1.1), then
\[
|A_0(z)| \leq \left| \frac{f^{(k)}(z)}{f(z)} \right| + |A_{k-1}(z)| \left| \frac{f^{(k-1)}(z)}{f(z)} \right| + \cdots + |A_1(z)| \left| \frac{f'(z)}{f(z)} \right|.
\]
By the definition of \( \rho = \rho_\varphi(f) \) and substituting (2.6), (2.7), (4.21) into (4.22), we obtain
\[
\varphi^{-1}((\alpha - \varepsilon) \log r) \leq |A_0(z)| \leq k B \varphi^{-1}(\beta \log r)[T(2r, f)]^{k+1}
\]
\[
\leq k B \varphi^{-1}(\beta \log r) \left[ \varphi^{-1}\left((\rho_1 + \varepsilon) \log 2r\right)\right]^{k+1}
\]
\[
\leq \left[ \varphi^{-1}\left((\beta + \frac{\varepsilon}{2}) \log 2r\right)\right]^{k+2} \leq \varphi^{-1}(\beta \log r)
\]
holds for all \( z \) satisfying \(|z| = r \in G_2 \setminus ([0, 1] \cup E_1)\) as \(|z| = r \to +\infty\). Since \( G_2 \setminus E_1 \) is a set of infinite logarithmic measure, then there exists a sequence of points \(|z_n| = r_n \in G_2 \setminus E_1\) tending to \(+\infty\). Hence, by (4.23) we have
\[
\varphi^{-1}((\alpha - \varepsilon) \log r_n) \leq \varphi^{-1}(\beta \log r_n)
\]
holds for all \( z_n \) satisfying \(|z_n| = r_n \in G_2 \setminus E_1\) as \(|z_n| = r_n \to +\infty\). By the monotonicity of \( \varphi^{-1} \) and arbitrariness of \( \varepsilon(0 < 2\varepsilon < \alpha - \beta) \), one can see that \( \alpha \leq \beta \) which contradicts our assumption. Then, \( \rho_\varphi(f) \geq \alpha \).

On the other hand, it follows by a similar proof in Theorem 1 that
\[
\rho_\varphi(f) \leq \alpha.
\]
Therefore \( \rho_\varphi(f) = \alpha \). In order to show that all solutions \( f \) of equation (1.2) satisfy \( \rho_\varphi(f) = \alpha \) with at most one exceptional solution, say \( f_0 \), satisfying \( \rho_\varphi(f_0) < \alpha \), we suppose that there exist two distinct meromorphic solutions \( f_0 \) and \( f_0^* \) of equation (1.2) satisfying \( \rho_\varphi(f_0), \rho_\varphi(f_0^*) \) \(<\alpha\). Then, \( f = f_0 - f_0^* \) is also a non-zero meromorphic solution of (1.1) and satisfies
\[
\rho_\varphi(f) = \rho_\varphi(f_0 - f_0^*) \leq \max\{\rho_\varphi(f_0), \rho_\varphi(f_0^*)\} < \alpha
\]
which contradicts the proof of the first part of (ii). By assumptions of Theorem 7, for all solutions \( f \) of equation (1.2) satisfying \( \rho_\varphi(f) = \alpha \), we have by Lemma 9
\[
\max\{\rho_\varphi(F), \rho_\varphi(A_j)\}, \ j = 0, 1, \ldots, k - 1\} = \rho_\varphi(f) < \alpha = \rho_\varphi(f).
\]
By using Lemma 8, we obtain \( \lambda_\varphi(f) = \lambda_\varphi(f_0) = \rho_\varphi(f) \) and hence
\[
\lambda_\varphi(f) = \lambda_\varphi(f) = \rho_\varphi(f) = \alpha
\]
with at most one exceptional solution \( f_0 \) satisfying \( \rho_\varphi(f_0) < \alpha \).

\section{Conclusion}

In this paper, by using the concepts of \( \varphi \)-order and \( \varphi \)-type, we have studied the growth of meromorphic solutions of higher order linear differential equations when among meromorphic coefficients having the maximal \( \varphi \)-order, exactly one has its \( \varphi \)-type strictly greater than others. Many previous results due to Chyzhykov–Semchko, Belaïdi, Cao–Xu–Chen, Kinnunen have been extended. Now, it is interesting to study the growth of meromorphic solutions of such equations by using the concept of \((\alpha, \beta)\)-order called the generalized order introduced by Sheremeta [20], see the recent paper of Mulyava–Sheremeta–Trukhan [17].
